

Introducing a Playwright Test Framework Generator That Actually Helps Teams Ship Faster 🚀

I've built a lightweight, developer-friendly scaffolding CLI that generates battle-tested Playwright test projects in seconds: playwright-test-framework-generator. If you spend time setting up Playwright projects, linters, TypeScript configs, CI, and sensible test structure - this tool saves those hours and codifies best practices so teams can focus on writing tests, not scaffolding them.

What it does:

- Tool: playwright-test-framework-generator - a CLI that scaffolds Playwright projects from EJS templates.
- Targets: Web, API, Hybrid, and SOAP testing presets (example presets included).
- Outputs: Ready-to-run Playwright projects with linting, type checking, Husky hooks, CI templates, example tests, Reports, Notifications.

Features (concise)

- Presets: Web, API, Hybrid, SOAP – complete sample tests and helpers per preset.
- EJS Templating: Flexible templates under templates for easy customization.
- TypeScript + ESM: Opinionated, modern TypeScript setup with type: "module".
- Lint & Typecheck: ESLint + tsc --noEmit built into generated projects and CI templates.
- Husky Hooks: Pre-commit hooks and recommended lint-staged flows included.
- CI Templates: GitHub/GitLab workflows out-of-the-box under ci.
- Extendable: Add new presets or modify Answers shape in prompts.ts to extend variables.
- Developer Experience: npm run dev watcher, local CLI usage, and documented build/dev workflows.

Why this is a game changer

- Onboard fast: New team members get a consistent, quality-tested Playwright baseline instantly.
- Reduce setup drift: Generated projects include enforced lint/typecheck and Husky, reducing inconsistent local setups and CI surprises.
- Ship tests faster: Teams stop wasting days wiring configs - they start writing tests the same day.
- Enterprise-ready: Includes SOAP preset and CI templates for teams testing legacy APIs and modern web apps.
- Maintainable templates: EJS template model makes upgrades and company-specific customizations straightforward.

Who should care

- Test engineers and SDETs who want a consistent baseline.
- QA leads standardizing Playwright usage across teams.
- Developers who want to add automated tests quickly to features.
- DevOps/Platform teams that provide on-demand test projects.

Quick example (how to try)

- Build locally: `npm run build`
- Scaffold a new project: `npx playwright-test-framework-generator init my-playwright-tests --preset hybrid --reporter allure --ci github`
- Fast dev loop: `npm run dev` while editing templates

Proof points & developer ergonomics

- Opinionated defaults (ESLint, Husky, TypeScript) reduce friction.
- Templates include sample tests, reporters, and package.json scripts so generated projects are runnable immediately.
- Clear docs and examples under docs and docs/ to guide teams.

Call To Action

- Try it now on GitHub:
<https://github.com/AshisRaj/playwright-test-framework-generator.git>
- Open an issue or PR with new presets or template improvements.
